

ADME NTP Study S0611 Lauric acid diethanolamine condensate

The contract laboratory abbreviation for the test article is LDEA.

Sex/Species: adult male F344 rats and B6C3F1 mice.

Vehicles: intravenous, water:Emulphor 10:1; oral gavage, water; dermal, 95% ethanol.

CASRN 120-40-1

Radiolabeled with carbon-14 randomly on the diethanolamine (DEA) moiety; [¹⁴C]Lauric acid diethanolamine condensate.

Lauric acid diethanolamine condensate Studies Performed:

1. Single 25 mg/kg intravenous administration in rats with sacrifice 72 hours postdose. (Tables 1 and 2)
2. Single 25 mg/kg intravenous administration in rats with serial sacrifice at 0.25, 0.75, 2, 6, and 24 hours. (Tables 3 and 4)
3. Single 1000 mg/kg oral gavage administration in rats with sacrifice 72 hours postdose. (Table 5)
4. Single 25 or 400 mg/kg dermal administration in rats with sacrifice 72 hours postdose (with dose site covered – Tables 6, 7, 8, and 9)
5. Single 100 mg/kg dermal administration in rats with blood collection up to 24 hours. (with dose site covered – Tables 10 and 11)
6. Repeat 25 mg/kg/day dermal exposure in rats for up to 3 weeks with (Table 12) and without (Table 13) covered dose sites; determination of percent absorption at 6, 24, 48, and 72 hours after each radiolabeled dose.
7. Single 50 mg/kg intravenous administration in mice with serial sacrifice at 0.25, 0.75, 2, 6, 24, and 72 hours postdose. (Table 14)
8. Single 50 mg/kg dermal administration in mice with sacrifice 72 hours postdose (with dose site covered – Table 15)
9. Single 100 mg/kg dermal administration in mice with sacrifice 72 hours postdose (with dose site covered – Table 16)
10. Single 200 mg/kg dermal administration in mice with sacrifice 72 hours postdose (with dose site covered – Table 17)
11. Single 800 mg/kg dermal administration in mice with sacrifice 72 hours postdose (with dose site covered – Table 18)

In the repeat dermal dose study, two groups of rats (with and without protective appliances) were dosed 5 days per week for 19 days (25/mg/kg/day) with Day 1 being a Monday. Radiolabeled doses were applied on days 3, 7, and 17. Animals were housed in metabolism cages for 72 hours after each radiolabeled dose to allow for collection of urine and feces. In addition to the initial dose area preparation, the dose site area of each rat was clipped and washed with water soaked gauzes on days 8 and 15 (new foam appliance were added after washing for the protected dose site group). Animals were sacrificed 72 hours after application of the last radiolabeled dose.

Serial blood samples were taken (Tables 4, 10, 11, and 14) but no pharmacokinetic analysis was performed.
