

Figure 1. Uterine subserosal cyst from a SD rat. A shows a 3-mm raised, fluid-filled cyst (arrow) on the left uterine horn (UtH). B is a low-magnification image of the cyst that is present between the serosa and the outer myometrial layer and not associated with uterine cavity. The inset shows the cyst lined by a single layer of flattened cuboidal epithelium (arrowhead). Note, lightly basophilic staining flocculent intraluminal material. SD = Sprague-Dawley, UtB = fused uterus and cervix, V = vagina.
