

Figure 4. The overall average quickscores of immunohistochemical markers evaluated in uterine subserosal cyst epithelium or wall were categorized as 0 to 1 = negative, 2 to 6 = weak, 7 to 12 = moderate, and 13 to 18 = strong. Overall, cyst walls displayed moderate positive staining for SMA; and epithelia were strongly positive for CK-18 and PAX8, moderate for ER-, weak for PR, and negative for GATA3. Data are expressed as mean + standard error of mean. CK-18 = cytokeratin 18, ER- = estrogen receptor , PAX8 = paired
